### **Bankruptcy and Liquidation Prediction by Logistic Regression**

- What are the variables associated with bankruptcy and liquidation?
- Which company does model suggest will go bankrupt or liquidate in the next three years?

## WRDS Compustat – Capital IQ <sup>1</sup>

- 226,866 observations × 981 variables
- Fundamentals Annual of companies that are actively trading on the NYSE, AMEX, NASDAQ, TSX, or NYSE/Arca exchanges from 2000 to 2020

## United States Cities Database <sup>2</sup>

- 29,488 observations × 17 variables
- This data include city name, state abbr., state name, county fips, county name, longitude and latitude of city, etc.

## Variable description 1

**Response variable** The response variable BL is defined as binary as follows:

$$BL = \begin{cases} 1 & \text{if it went bankrupt or liquidated in 2011–13.} \\ 0 & \text{otherwise. (solvent company)} \end{cases}$$

year	All deletion	Bankruptcy	Liquidation	B + L
2011	241	1	16	17
2012	363	6	29	35
2013	348	8	38	46
2014	369	3	47	50
2015	348	8	36	44
2016	356	10	31	41
2017	273	6	1	7
2018	243	8	1	9
2019	266	16	0	16
2020	99	4	0	4

**Table 1:** Number of deleted companies

### Explanatory variables: fundamentals of 2010

**aco** : current assets that are not included in cash, cash equivalents, receivables or inventory on the Balance Sheet.

**aqpl1** : assets measured at fair value using observable inputs based on unadjusted quoted prices for identical instruments in active markets.

**caps** : a group of capital accounts other than capital stock or retained earnings.

**csho** : net number of all common shares outstanding at year-end, excluding treasury shares and scrip.

**cstk** : total par, carrying, or stated value of all common/ordinary capital.

**glcea** : after-tax gain or loss on a sale that is excluded from the Standard & Poor's Core Earnings calculation.

## Explanatory variables: fundamentals of 2010

**idbflag** : source of data for the company.

**optfvgr** : weighted average fair value of options granted during the year.

**spced** : Standard & Poor's Core Earnings EPS diluted value.

**stalt** : status alert as to whether the company is in bankruptcy or undergoing a leveraged buyout.

**stkcpa** : amount of stock-based compensation expensed on the Income Statement during the current period on an after-tax basis.

# Methodology

## Logistic regression model

$$y_i (= \text{BL}_i) \sim \text{Bernoulli}(p_i)$$

$$\text{logit}(p_i) = \log \frac{p_i}{1 - p_i} = \beta X_i, \quad p_i = \frac{1}{1 + e^{-\beta X_i}}$$

$$\text{where } \beta = \begin{bmatrix} \beta_0 & \beta_1 & \cdots & \beta_m \end{bmatrix}, \quad X_i = \begin{bmatrix} 1 & x_{1,i} & \cdots & x_{m,i} \end{bmatrix}^T$$

## Maximum Likelihood Estimation (MLE)

$$L(\beta | X_1, \dots, X_n) = \prod_{i=1}^n (p_i)^{y_i} (1 - p_i)^{1-y_i}$$

$$\log L(\beta | X_1, \dots, X_n) = \sum_{i=1}^n y_i \log p_i + \sum_{i=1}^n (1 - y_i) \log(1 - p_i)$$

**EDA**

---

# Handling missing values with NAICS

## **North American Industrial Classification System**<sup>3</sup>

NAICS is a hierarchical structure and can consist of up to six digits/levels. It is a comprehensive system covering all economic activities. There are 20 sectors and 1,057 industries in 2017 NAICS United States.

## **NAICS vs. SIC**

The NAICS was developed to eliminate the inconsistent logic utilized in the SIC system and to increase specificity from the 4 digit SIC system by creating a 6 digit NAICS code. The last revision of the SIC was in 1987.

---

<sup>3</sup><http://www.census.gov/epcd/www/naics.html>

# Structure of 2017 NAICS

Sector	N	Description
11	18	Agriculture, Forestry, Fishing and Hunting
21	426	Mining, Quarrying, and Oil and Gas Extraction
22	248	Utilities
23	78	Construction
31–33	2193	Manufacturing
	42	Wholesale Trade
44–45	235	Retail Trade
48–49	148	Transportation and Warehousing
	51	Information
	52	Finance and Insurance
	53	Real Estate and Rental and Leasing
	54	Professional, Scientific, and Technical Services
	55	Management of Companies and Enterprises
	56	Administrative and Support and Waste Management and Remediation Services
	61	Educational Services
	62	Health Care and Social Assistance
	71	Arts, Entertainment, and Recreation
	72	Accommodation and Food Services
	81	Other Services (except Public Administration)
	92	Public Administration
	99	Nonclassifiable

# Examples

Monster Beverage Corp		Kellogg Co

312111	Soft Drink Manufacturing	311230	Breakfast Cereal Manufacturing
Coca Cola Consolidated Inc		Nike Inc	
31	Manufacturing	31	Manufacturing
312	Beverage and Tobacco Product Manufacturing	316	Leather and Allied Product Manufacturing
3121	Beverage Manufacturing	3162	Footwear Manufacturing
31211	Soft Drink and Ice Manufacturing	31621	Footwear Manufacturing
312111	Soft Drink Manufacturing	316210	Footwear Manufacturing

**Table 2:** Replacing order: ↑

# Test of equality of two variances

## F-test

Let  $X_{j,1}, \dots, X_{j,n_j}$  be i.i.d. random variables with normal density and  $\bar{X}_j$  be sample means for  $j = 1, 2$ .

$$F = \frac{s_1^2}{s_2^2} \sim F(n_1 - 1, n_2 - 1) \quad \text{where } s_j^2 = \frac{1}{n_j - 1} \sum_{i=1}^{n_j} (X_{j,i} - \bar{X}_j)^2$$

## Statistical test <sup>4</sup>

$H_{F,0}$ : Two normal populations have the same variance.

$H_{F,1}$ : True ratio of variances is not equal to 1.

---

<sup>4</sup> $H_{F,0}$ : Homogeneity of variance,  $H_{F,1}$ : Heteroscedasticity of variance

## Tests of equality of two means

### Student's t-test (when $H_{F,0}$ is accepted)

$$t = \frac{\bar{X}_1 - \bar{X}_2}{s_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} \sim t(n_1 + n_2 - 2)$$

$$\text{where } s_p = \sqrt{\frac{(n_1 - 1)s_{X_1}^2 + (n_2 - 1)s_{X_2}^2}{n_1 + n_2 - 2}}$$

### Welch's t-test (when $H_{F,1}$ is accepted)

$$t = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}} \sim t(\nu) \quad \text{where } \nu = \frac{\left(\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}\right)^2}{\frac{(s_1^2/n_1)^2}{n_1-1} + \frac{(s_2^2/n_2)^2}{n_2-1}}$$

## Statistical test

$H_{t,0}$ : The two population means are equal.

$H_{t,1}$ : True difference in means is not equal to 0.

capxv	cogs	dilavx	dvt	ib	lifrp	mrc5	optprcgr	rect	txc	txtubposinc	

## Standardization

$$X_{\text{changed}} = \frac{X - \mu}{\sigma}$$

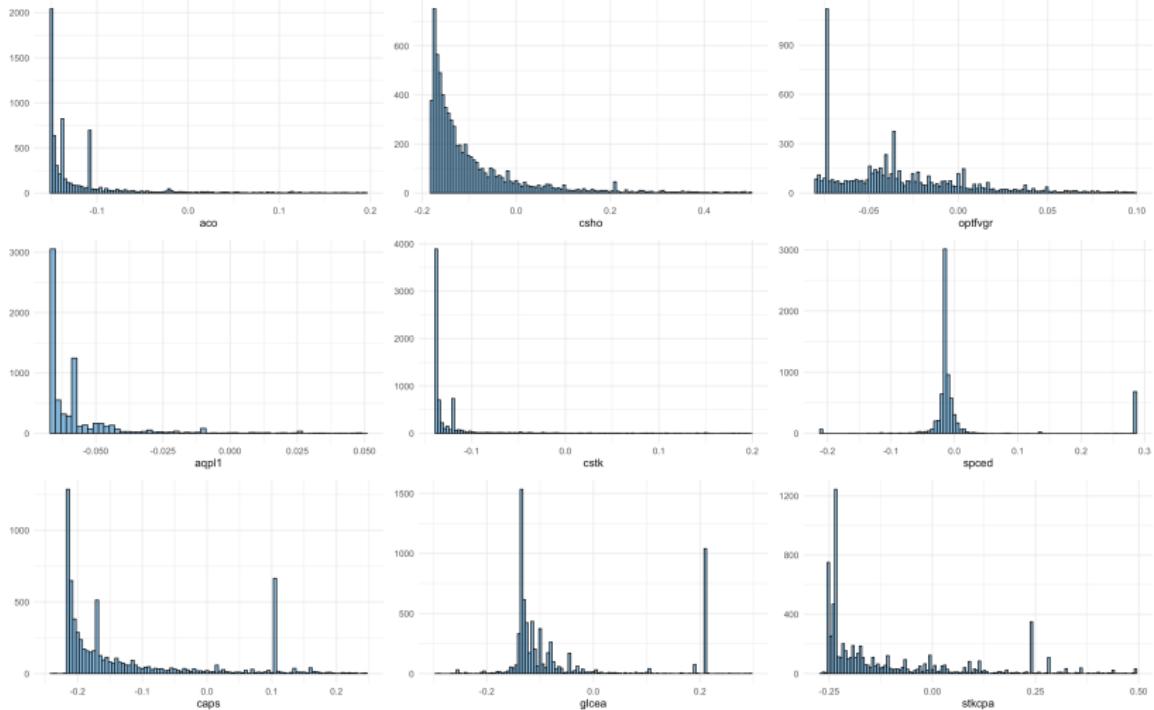

Standardized regression coefficients can be used to directly compare the effects of independent variables because standardized variables have the effect of eliminating the measurement unit or variation of the original variable.

## Summary statistics of continuous variables

Statistic	N	Mean	St. Dev.	Min	Pctl(25)	Pctl(75)	Max
aco	7,380	0.000	1.000	-0.150	-0.149	-0.107	42.624
aqpl1	7,380	0.000	1.000	-0.067	-0.067	-0.056	55.435

**Table 3:** Summary statistics

# Histogram of continuous variables (truncated)

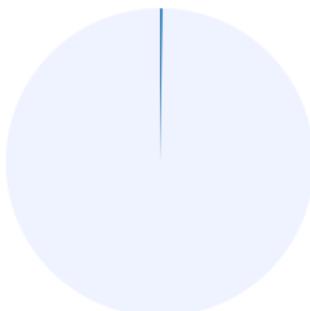

# Pie chart of categorical variables

Response variable

Status Alert

International, Domestic, Both

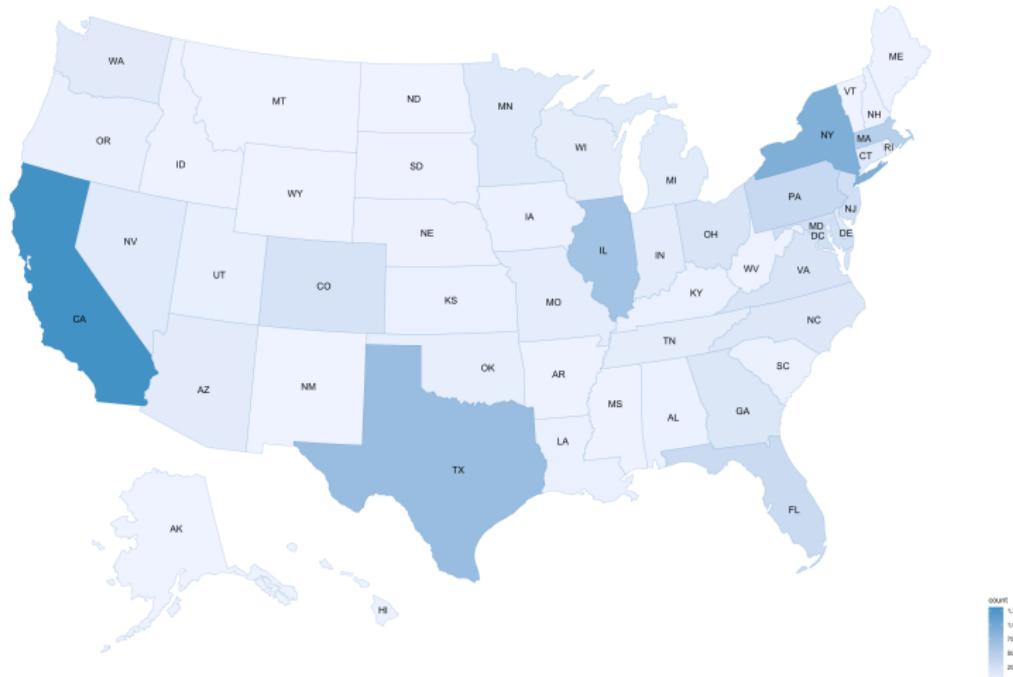

BL    0    1

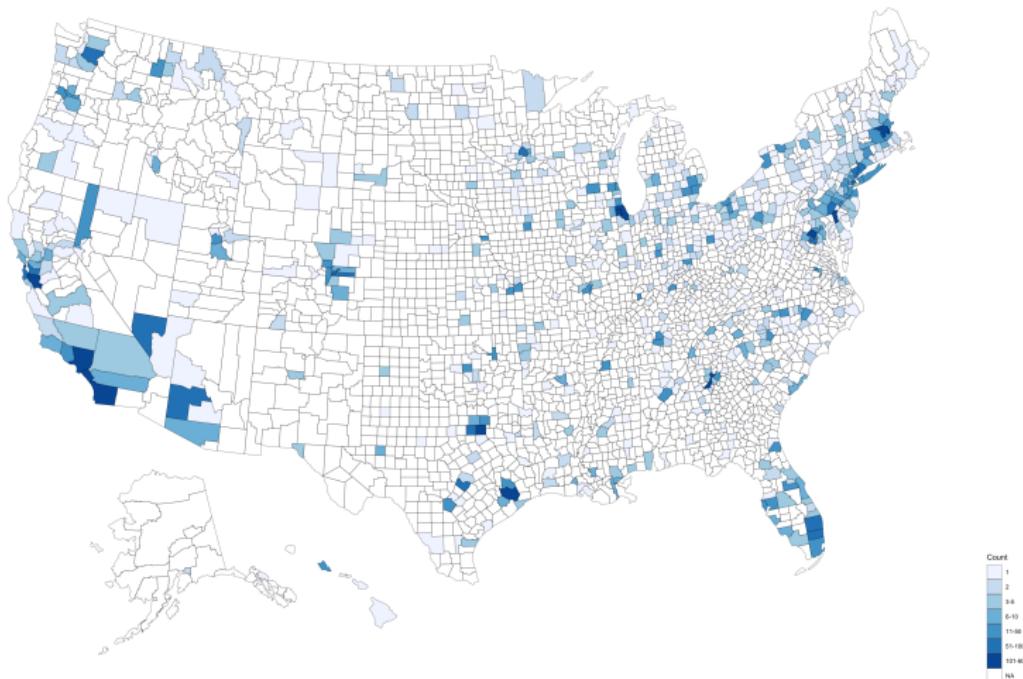

STALT    0    1

IDBFLAG    B    D

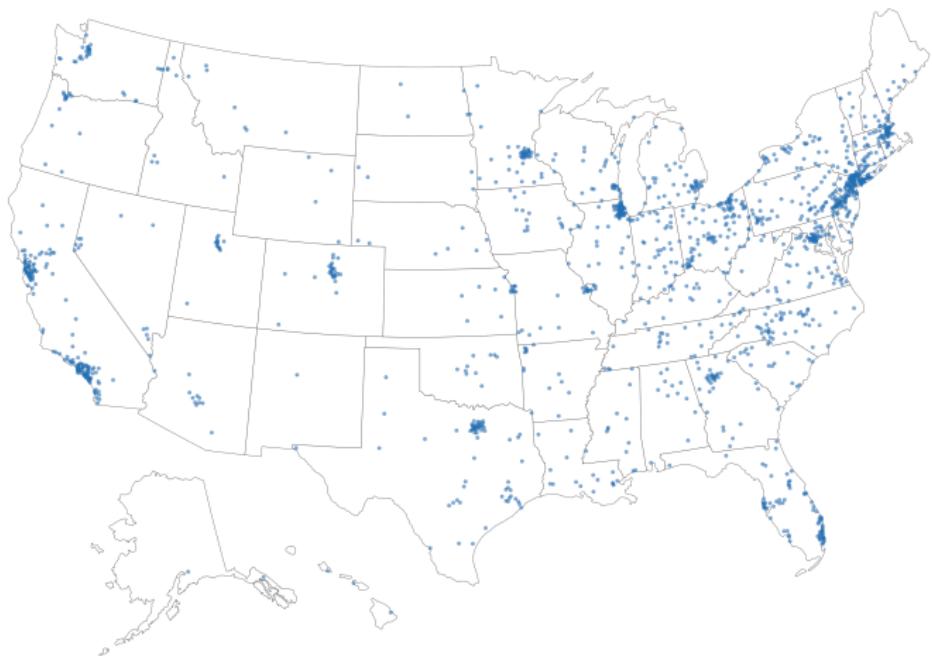

# Number of companies by state

# Number of companies by county

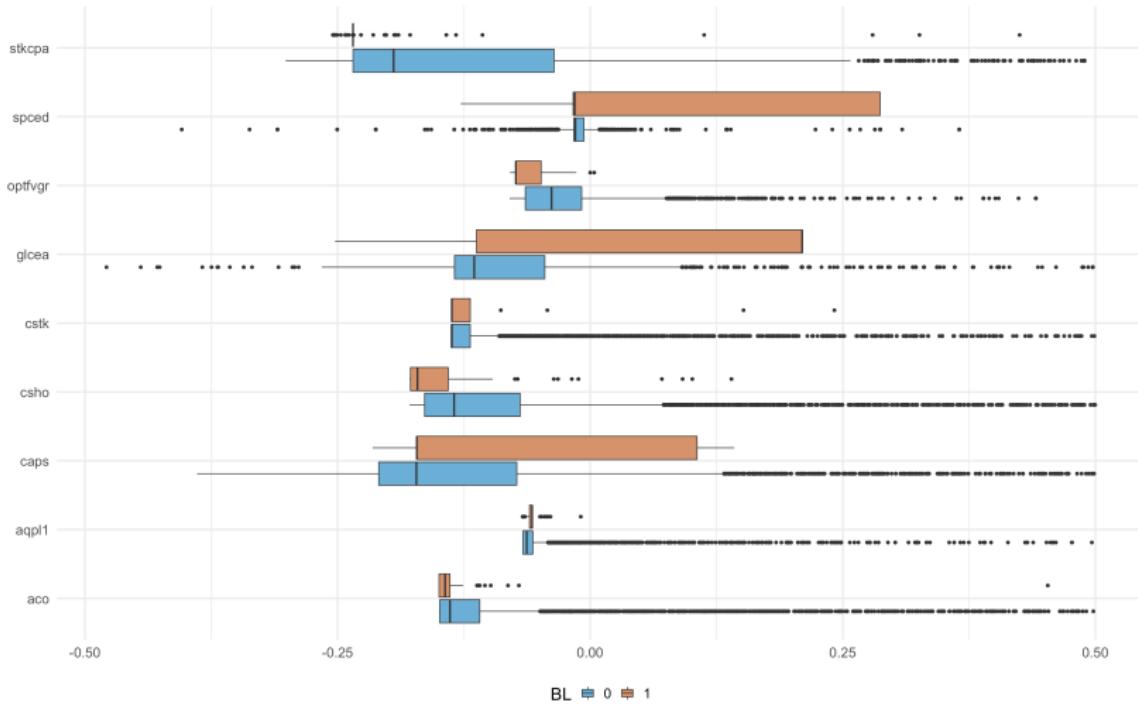

Plotting cities where the company is located

## Correlation analysis

- BL ~ continuous variables
- BL ~ categorical variables (stalt, idbflag)
- between continuous variables
- continuous variables ~ categorical variables (stalt, idbflag)
- between categorical variables (stalt ~ idbflag)

## Box plots (truncated)

## Tests of independence of two categorical variables

### Pearson's chi-squared test

$$\chi^2 = \sum_{i=1}^r \sum_{j=1}^c \frac{(n_{ij} - e_{ij})^2}{e_{ij}} \sim \chi^2((r-1)(c-1)) \quad \text{where } e_{ij} = \frac{n_{i\cdot} n_{\cdot j}}{n}$$

$H_0: p_{ij} = p_{i\cdot} p_{\cdot j}$  for all  $i, j$ .

$H_1: p_{ij} \neq p_{i\cdot} p_{\cdot j}$  for some  $i, j$ .

### Fisher's exact test

$$p = \frac{\binom{a+b}{a} \binom{c+d}{c}}{\binom{n}{a+c}} = \frac{\binom{a+b}{b} \binom{c+d}{d}}{\binom{n}{b+d}} \sim \text{Hypergeometric}(n, a+b, a+c)$$

$H_0:$  true odds ratio is equal to 1

$H_1:$  true odds ratio is not equal to 1

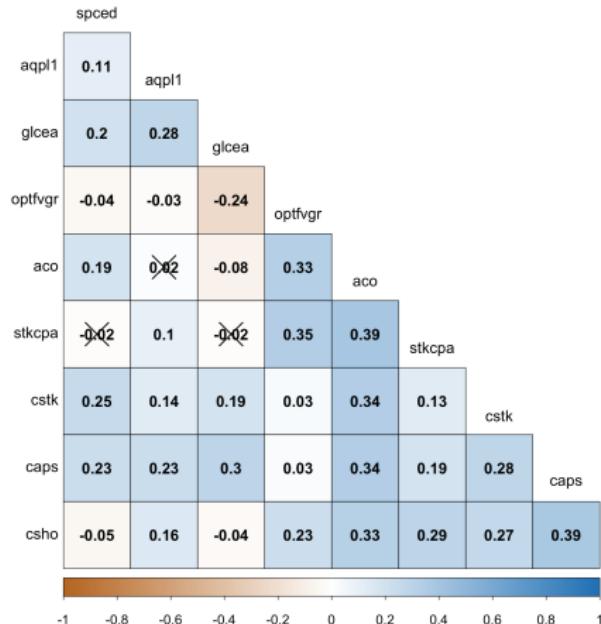

## Result of tests

Pearson's chi-squared test				Fisher's exact test			
	$\chi^2$	df	p-value	odds ratio	95% CI	p-value	
stalt	53.376	1	$2.755 \times 10^{-13}$	25.238	5.994 - 80.874	$4.441 \times 10^{-5}$	
idbfalg	3.911	1	0.048	$\infty$	1.299 - $\infty$	0.014	

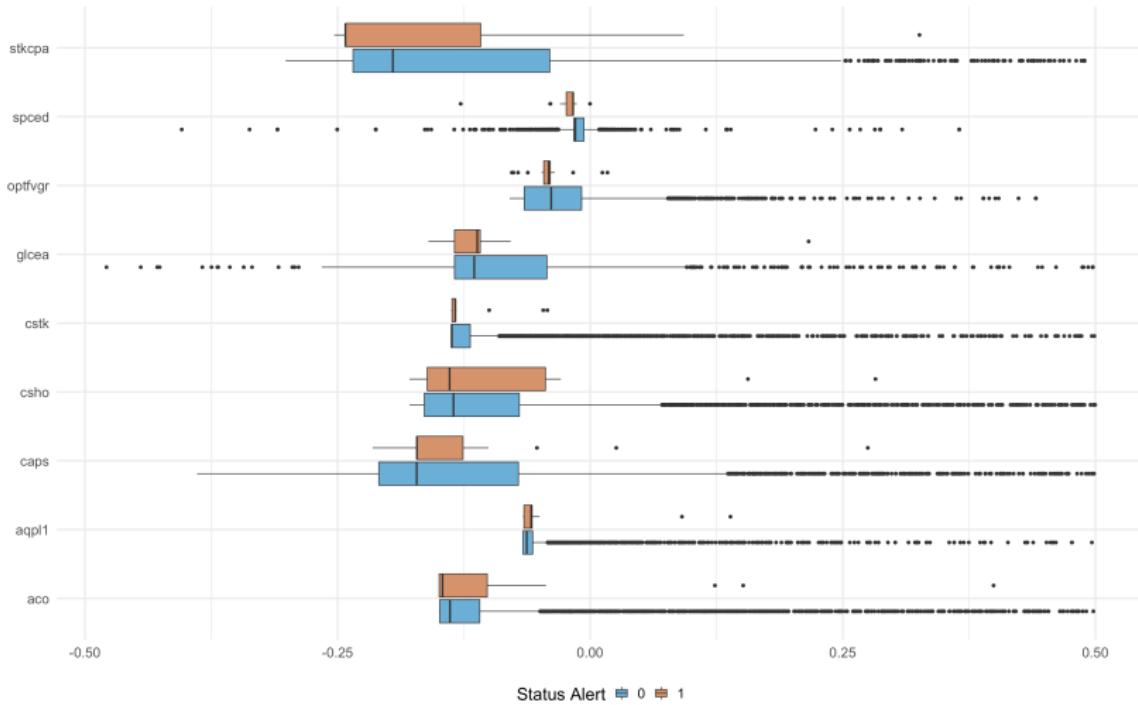

Neither stalt nor idbfalg are independent of BL.

That is, the two categorical variables are associated with BL.

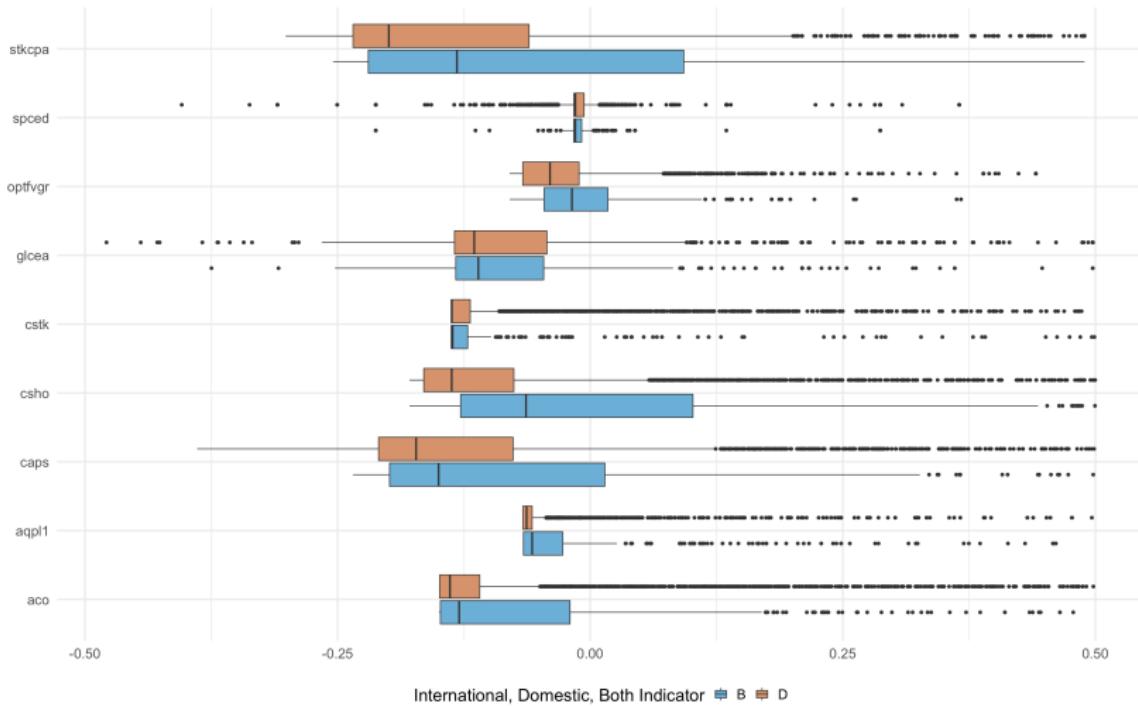

# Spearman correlogram with significance test

## Box plots (truncated)

## Box plots (truncated)

## Result of tests

Pearson's chi-squared test			Fisher's exact test		
$\chi^2$	df	p-value	odds ratio	95% CI	p-value
$2.648 \times 10^{-29}$	1	1	1.219	0.193 - 50.795	1

∴ stalt and idbflag are independent!

## Modeling

---

## Method 1: subsampling training data

The first method is to subsample the negative set to reduce it to be the same size as the positive set, then fit the logistic regression model with the reduced data set.

## Method 2: weighted logistic regression

For a data set containing 5% positives and 95% negatives, we can assign each positive observation a weight of 0.95, and each negative observation a weight of 0.05. The weighted likelihood can be written as

$$L(\beta) = \prod_{i=1}^n (p_i)^{(1-w)y_i} (1 - p_i)^{w(1-y_i)}$$

where  $w$  represents proportion of events in the population.

## Type I error vs. Type II error

### **Pros and cons of both methods**

Both of them predict a fair amount of true positives as positives and true negatives as positives. This means that Type II error decreases, but Type I error increases. However, it is more dangerous for a company that is actually going to go bankrupt to be predicted not to go bankrupt!

### **Subsampling – Training set vs. Test set**

**Training set:** 60 bankrupt companies and 600 not bankrupt companies

**Test set:** 16 bankrupt companies and 160 not bankrupt companies

# Stepwise selection by AIC

## Akaike Information Criterion (AIC)

Let  $k$  be the number of estimated parameters in the model and  $\hat{L}$  be the maximum value of the likelihood function for the model.

$$\text{AIC} = 2k - 2 \log \hat{L}$$

**Table 5:** Coefficients

## Final model

### Final model

Finally, our logistic regression model is

$$\begin{aligned}\log \frac{p_i}{1 - p_i} = & -203.6 - 7.19x_{aco,i} + 8.9x_{aqappl1,i} + 2.12x_{caps,i} \\ & - 7.58x_{csho,i} - 13.51x_{cstk,i} + 1.56x_{glcea,i} + 197.01x_{idbflag_D,i} \\ & - 19.96x_{optfvgr,i} - 2.42x_{spced,i} + 2.66x_{stalt_1,i} - 3.31x_{stkcpa,i}\end{aligned}$$

solving for  $p_i$ ,

$$p_i = (1 + \exp(203.6 + 7.19x_{aco,i} - 8.9x_{aqappl1,i} + \dots + 3.31x_{stkcpa,i}))^{-1}.$$

## Likelihood ratio test

### Likelihood ratio test

$LR = 2(ULF - RLF) \sim \chi^2_{df=q}$  where  $q$  is # of restrictions.

$$ULF - RLF = 402.12 - 311.41 = 90.71$$

$$q = 659 - 648 = 11$$

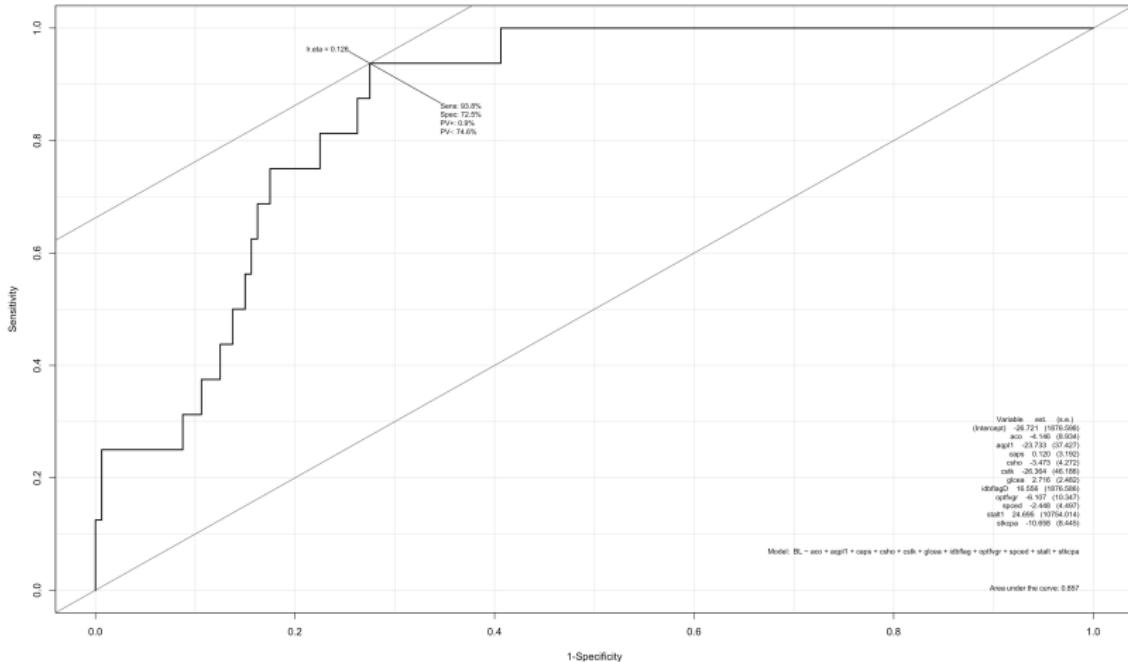

$$\text{p-value} = 1.210039 \times 10^{-14}$$

$$H_0: \beta_1 = \cdots = \beta_n = 0$$

$$H_1: \beta_i \neq 0 \text{ for at least one } i$$

Therefore, at least one explanatory variable can be considered significant in predicting the response variable.

# ROC curve

## Confusion matrix with cut-off 0.1267

# Terminology

- True Positives (TP)
  - These are cases in which we predicted positive (they go bankrupt or liquidate), and they actually went bankrupt or liquidated.
- True Negatives (TN)
  - We predicted negative, and they didn't actually go bankrupt or liquidate.
- False Positives (FP)
  - We predicted positive, but they didn't actually go bankrupt or liquidate.
  - Also known as a Type I error.
- False Negatives (FN)
  - We predicted negative, but they actually went bankrupt or liquidated. We cared more about this error.
  - Also known as a Type II error.

# Measuring performance 1

- Accuracy

- Overall, how often is the classifier correct?
- 

$$\frac{TP+TN}{\text{Total}} = \frac{14 + 117}{176} = 74.43\%$$

- Misclassification Rate (Error Rate)

- Overall, how often is it wrong?
- equivalent to 1 minus Accuracy
- 

$$\frac{FP+FN}{\text{Total}} = \frac{43 + 2}{176} = 25.57\%$$

## Measuring performance 2

- True Positive Rate (Sensitivity, Recall)
  - When it's actually positive, how often does it predict positive?
  -

$$\frac{\text{TP}}{\text{Actual Positive}} = \frac{14}{16} = 87.5\%$$

- False Positive Rate
  - When it's actually negative, how often does it predict positive?
  -

$$\frac{\text{FP}}{\text{Actual Negative}} = \frac{43}{160} = 26.875\%$$

- True Negative Rate (Specificity)
  - When it's actually negative, how often does it predict negative?
  - equivalent to 1 minus False Positive Rate
  -

$$\frac{\text{TN}}{\text{Actual Negative}} = \frac{117}{160} = 73.125\%$$

# Measuring performance 3

- Precision
    - When it predicts positive, how often is it correct?
    -
  - Prevalence
    - How often does the positive condition actually occur in test set?
    -
  - AUC (Area Under an ROC Curve) = 0.857
- $$\frac{\text{TP}}{\text{Predicted Positive}} = \frac{14}{57} = 24.56\%$$
- $$\frac{\text{Actual Positive}}{\text{Total}} = \frac{16}{176} = 9.09\%$$

## Conclusion

---

# Conclusion

## 11 selected variables

aco, aqpl1, caps, csho, cstk, glcea, idbflag, optfvgr, spced, stalt, stkcpa

## Performance

Accuracy: 74.43%, Sensitivity: 87.5%, Specificity: 73.13%

## Forecasting

Due to many missing values in above variables on 2020, we failed in forecasting. If variables are chosen in consideration of the 2020 missing values, the prediction will be successful because of good performance.
